# Math Circles. Group Theory. Solution Set 2. <br> Diana Carolina Castañeda Santos <br> dccastan@uwaterloo.ca <br> University of Waterloo 

March 27, 2019

## Solutions:

1. Find all the elements of $\left(\mathbb{Z}_{12}^{*}, \cdot\right)$ and draw out the multiplication table for this group.

The elements in $\mathbb{Z}_{12}^{*}$ are the units in $\mathbb{Z}_{12}$. These are the numbers that don't have common divisors with 12 . These are $1,5,7$, and 11 . The multiplication table is:

| $\cdot$ | 1 | 5 | 7 | 11 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 5 | 7 | 11 |
| 5 | 5 | 1 | 11 | 7 |
| 7 | 7 | 11 | 1 | 5 |
| 11 | 11 | 7 | 5 | 1 |

2. Find all values of $x$ in $\mathbb{Z}_{10}$ that satisfy the equation $3 x+9=1(\bmod 10)$.

$$
\begin{aligned}
3 x+9 & =1(\bmod 10) \\
3 x & =-8(\bmod 10) \\
3 x & =2(\bmod 10)
\end{aligned}
$$

We try all values of $x$ from 0 to 9 and we see that $x=4$ is the only solution to this equation.
3. Does the equation $x^{2}=-1(\bmod 5)$ have solutions in $\left(\mathbb{Z}_{5}^{*}, \cdot\right)$ ?

We can replace $x$ by the possible values that it could be in $\mathbb{Z}_{5}$.

| $x$ | 0 | 1 | 2 | 3 | 4 |
| :---: | :--- | :--- | :--- | :--- | :--- |
| $x^{2}$ | 0 | 1 | 4 | 4 | 1 |

Recall that $-1=4(\bmod 5)$. Hence $x=2$ and $x=3$ are the solutions of the equation.
4. Determine the order of the following groups:
(a) $\left|D_{5}\right|=10$.
(b) $\left|\left(\mathbb{Z}_{12},+\right)\right|=12$.
(c) $\left|\left(\mathbb{Z}_{12}^{*}, \cdot\right)\right|=4$.
(d) $\left|S_{4}\right|=24$
(e) $\left|\left(\mathbb{Z}_{p}^{*}, \cdot\right)\right|=p-1$ where $p$ is prime.
(f) $\left|S_{n}\right|=n$ ! where $n \in \mathbb{N}$
5. Determine the order of the following elements
(a) $|i|=4$ in $\mathcal{Q}_{8}$.
(b) $|3|=8$ in $\left(\mathbb{Z}_{8},+\right)$.
(c) $|3|=2$ in $\left(\mathbb{Z}_{8}^{*}, \cdot \cdot\right)$.
(d) $|a|$ for each $a$ in $\left(\mathbb{Z}_{5}^{*}, \cdot\right)$.

$$
\begin{aligned}
|1| & =1 \\
|2| & =4 \\
|3| & =4 \\
|4| & =2
\end{aligned}
$$

(e) $|H V|=\left|R^{2}\right|=2$ in $D_{4}$.
6. Determine all the groups of order 4 .

There are only two non-isomorphic groups $\left(\mathbb{Z}_{4},+\right)$ and $\left(\mathbb{Z}_{8}^{*}, \cdot\right)$.
7. Determine all groups of order 5.

There is only one group of order 5 which is $\left(\mathbb{Z}_{5},+\right)$.
8. Draw out the multiplication table of $S_{3}$.

| $\cdot$ | id | $(132)$ | $(123)$ | $(12)$ | $(13)$ | $(23)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| id | id | $(132)$ | $(123)$ | $(12)$ | $(13)$ | $(23)$ |
| $(132)$ | $(132)$ | $(123)$ | id | $(23)$ | $(12)$ | $(13)$ |
| $(123)$ | $(123)$ | id | $(132)$ | $(13)$ | $(23)$ | $(12)$ |
| $(12)$ | $(12)$ | $(13)$ | $(23)$ | id | $(132)$ | $(123)$ |
| $(13)$ | $(13)$ | $(23)$ | $(12)$ | $(123)$ | id | $(132)$ |
| $(23)$ | $(23)$ | $(12)$ | $(13)$ | $(132)$ | $(123)$ | id |

9. We know that $D_{3}, S_{3}$ and $\left(\mathbb{Z}_{6},+\right)$ are groups of order 6 . Are they isomorphic? are all of them non-isomorphic?
Since $D_{3}$ and $S_{3}$ are not abelian, and $\left(\mathbb{Z}_{6},+\right)$ is abelian, we can say that $\left(\mathbb{Z}_{6},+\right)$ is not isomorphic to $D_{3}$ and $S_{3}$.

To decide if $D_{3}$ and $S_{3}$ are isomorphic, we look at the multiplication tables. The multiplication table for $S_{3}$ was found in problem 8. Also, in the previous lesson we saw that the multiplication table for $D_{3}$ is:

| $\cdot$ | $e$ | $R$ | $R^{2}$ | $V$ | $D$ | $D^{\prime}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $e$ | $e$ | $R$ | $R^{2}$ | $V$ | $D$ | $D^{\prime}$ |
| $R$ | $R$ | $R^{2}$ | $e$ | $D^{\prime}$ | $V$ | $D$ |
| $R^{2}$ | $R^{2}$ | $e$ | $R$ | $D$ | $D^{\prime}$ | $V$ |
| $V$ | $V$ | $D$ | $D^{\prime}$ | e | $R$ | $R^{2}$ |
| $D$ | $D$ | $D^{\prime}$ | $V$ | $R^{2}$ | e | $R$ |
| $D^{\prime}$ | $D^{\prime}$ | $V$ | $D$ | $R$ | $R^{2}$ | e |

Hence, if we rename: $e \leftrightarrow \mathrm{id}, R \leftrightarrow(132), R^{2} \leftrightarrow(123), V \leftrightarrow(12), D \leftrightarrow$ (13), and $D^{\prime} \leftrightarrow(23)$. The two tables are the same. Thus $D_{3}$ is isomorphic to $S_{3}$.
10. Draw out the multiplication table of the group of quaternions $\left(\mathcal{Q}_{8}, \cdot\right)$.

| $\cdot$ | 1 | -1 | $i$ | $-i$ | $j$ | $-j$ | $k$ | $-k$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | -1 | $i$ | $-i$ | $j$ | $-j$ | $k$ | $-k$ |
| -1 | -1 | 1 | $-i$ | $i$ | $-j$ | $j$ | $-k$ | $k$ |
| $i$ | $i$ | $-i$ | -1 | 1 | $k$ | $-k$ | $j$ | $-j$ |
| $-i$ | $-i$ | $i$ | 1 | -1 | $-k$ | $k$ | $-j$ | $j$ |
| $j$ | $j$ | $-j$ | $-k$ | $k$ | -1 | 1 | $i$ | $-i$ |
| $-j$ | $-j$ | $j$ | $k$ | $-k$ | 1 | -1 | $-i$ | $i$ |
| $k$ | $k$ | $-k$ | $j$ | $-j$ | $-i$ | $i$ | -1 | 1 |
| $-k$ | $-k$ | $k$ | $-j$ | $j$ | $i$ | $-i$ | 1 | -1 |

11. Prove that inverses are unique. In other words, prove that if $a b=b a=e=$ $a c=c a$ then $c=b$.

Proof. Since $c$ is an inverse of $a$, we know $a c=e$. We can multiply this equation by the left by $b$ and we see that

$$
\begin{aligned}
b(a c) & =b \cdot e \\
(b a) c & =b \cdot e \\
e \cdot c & =b \cdot e \\
c & =b .
\end{aligned}
$$

The second equation is possible by the associativity property. the third equation is true because $b$ is inverse of $a$, and the last equation is possible because of the identity property.
