Problem of the Week
Problem C and Solution
An Average Quiz

Problem
For a recent quiz about averages, the following information is known:

- There were three questions on the quiz.
- Each question was worth 5 marks.
- Each question was marked right or wrong (no part marks).
- 30% of the students got all 3 questions correct.
- 40% of the students got exactly 2 questions correct.
- 25% of the students got exactly 1 question correct.
- 5% of the students got no question correct.

Determine the overall class average for this quiz.

Solution
Solution 1
To determine the average, we must determine the sum of all the marks and divide by the number of students. We will use the information given for a class of 100 students.

Since 30% of the students got all 3 questions correct, 30 students each scored 15 marks and earned a total of $30 \times 15 = 450$ marks.

Since 40% of the students got exactly 2 questions correct, 40 students each scored 10 marks and earned a total of $40 \times 10 = 400$ marks.

Since 25% of the students got exactly 1 question correct, 25 students each scored 5 marks and earned a total of $25 \times 5 = 125$ marks.

Since 5% of the students got no questions correct, 5 students scored 0 marks and earned a total of $5 \times 0 = 0$ marks.

The total number of marks earned by the 100 students was $450 + 400 + 125 + 0 = 975$.

The average mark on the quiz was then $975 \div 100 = 9.75$ out of 15, or 65%.
Solution 2

To determine an average, we must determine the total of all the marks and divide by the number of students.

Let \( n \) represent the number of students who wrote the test where \( n \) is a positive integer.

Since 30\% of the students got all 3 questions correct, \( 0.30n \) students each scored 15 marks and earned a total of \( 0.30n \times 15 = 4.5n \) marks.

Since 40\% of the students got exactly 2 questions correct, \( 0.40n \) students each scored 10 marks and earned a total of \( 0.40n \times 10 = 4n \) marks.

Since 25\% of the students got exactly 1 question correct, \( 0.25n \) students each scored 5 marks and earned a total of \( 0.25n \times 5 = 1.25n \) marks.

Since 5\% of the students got no questions correct, \( 0.05n \) students scored 0 marks and earned a total of \( 0.05n \times 0 = 0 \) marks.

The total number of marks earned by the \( n \) students was \( 4.5n + 4n + 1.25n + 0 = 9.75n \).

The average mark on the quiz was then \( \frac{9.75n}{n} = 9.75 \) (since \( n \neq 0 \)) out of 15, or 65\%.
